POLLARIS

TOOL SETUP

Project: Pollaris – Community-Based Decision-Making Web Application
Prepared for Project Assignment 1 (PA1)

1. Introduction

This section describes the tools used to support the planning, development, communication, and coordination of the Pollaris project. Each tool serves a specific purpose, from assigning tasks and managing source code to discussing ideas, creating UI prototypes, and following course announcements. Together, these tools help the team stay organized and work toward the project goals.

2. Jira – Task Management

Purpose: Jira is used to plan project activities, assign tasks to team members, and track progress. It helps the team organize responsibilities and monitor deadlines throughout development.

Project information

- Project: Pollaris
- Project board: Scrum Board
- Project key: To be verified in Jira
- Jira Board: Open Pollaris Jira Board

Setup and Usage:

- The team uses Jira to organize tasks according to the project plan and monitor their progress. Tasks should be assigned to the responsible team members and updated as work progresses.
- The Sprint 1 board should reflect the actual status of the project's inception activities, while the backlog should contain the tasks planned for subsequent sprints.

3. Git & GitHub – Source Code Management

Purpose: Git and GitHub are used to manage the project's source code and track changes. They support collaboration by allowing team members to work on different features while maintaining a shared and organized codebase.

Repository

Pollaris GitHub Repository

Repository Structure

src/: Application source code.

docs/management/: Project plans, weekly reports, and status reports.

docs/requirements/: Vision documents and use cases.

docs/analysis and design/: Software architecture, UML diagrams, and UI designs.

docs/test/: Test plans, test cases, and test reports.

pa/: Assignment submissions organized by phase.

Setup and Usage:

- Create a shared GitHub repository for Pollaris and provide access to all team members.
- Store the application's source code, configuration files, documentation, and other relevant project resources in the repository.
- Use Git to record changes and maintain a history of the development process.
- Create separate branches for individual features or bug fixes when team members work in parallel.
- Use clear commit messages and review changes before merging them into the main branch.

4. Facebook – Team Communication and Discussion

Purpose: Facebook is used as the team's communication and discussion platform. It provides a convenient place for members to exchange ideas, share updates, ask questions, and coordinate project activities.

Setup and Usage:

- Create a dedicated group or group chat for the Pollaris team.
- Use the group to discuss project requirements, design ideas, implementation decisions, and problems encountered during development.
- Share progress updates, meeting arrangements, relevant files, and useful links with team members.
- Confirm task responsibilities and coordinate next steps through team discussions.

Keep important decisions and updates easy to find so all members can stay informed.

5. ChatGPT – UI Prototype Support

Purpose: ChatGPT supports the UI prototyping process by generating interface ideas, suggesting screen layouts, and helping the team explore user flows before implementation.

Setup and Usage:

The team can use ChatGPT to develop and refine design ideas for the main Pollaris screens, including:

1. Login and registration.
2. Home page and poll discovery.
3. Poll creation.
4. Poll details and voting.
5. Poll results.
6. AI-generated opinion summaries.

The team reviews the generated suggestions and adapts them to the project's requirements. AI-generated descriptions alone do not replace the actual UI sketches or prototypes required by PA1.

6. Moodle – Course Announcements

Purpose: Moodle is used to follow announcements and instructions provided by the lecturer. It helps the team stay informed about assignment requirements, deadlines, learning materials, and other course-related updates.

Setup and Usage:

- Check Moodle regularly for announcements and new information from the lecturer.
- Review assignment instructions, submission requirements, and deadlines relevant to PA1.
- Download and refer to course materials or guidelines when preparing project deliverables.
- Share important course updates and deadlines with team members when necessary.
- Use the latest instructions on Moodle to confirm that the project work meets the course requirements.

7. Tool Integration and Team Workflow

These tools support different parts of the Pollaris workflow. Jira is used to assign tasks and track progress; Git and GitHub manage source code and changes; Facebook supports team communication and discussion; ChatGPT helps generate and refine UI prototype ideas; and Moodle provides course announcements and assignment instructions. Team members will share relevant updates and links across these tools to keep task progress, design decisions, development work, and course requirements aligned.

Note: This section describes the team's intended tool setup and usage. Before submission, the team should confirm that the tools are being used as described and that all members can access the relevant Jira board, GitHub repository, Facebook group or chat, ChatGPT-generated UI prototype materials, and Moodle course page.
